

SRINIVASAN VIJAYARAGHAVAN

DevOps / Site Reliability Engineer — Cloud Infrastructure, Reliability & Release Automation
Bangalore, India · +91 97910 25934 · srinivasan.shyam2000@gmail.com · srinidevops.com
U.S. Citizen · OCI Holder — Authorized to work in both the States and India

SUMMARY

DevOps/SRE engineer with 5 years owning release, upgrade, and disaster-recovery automation for a multi-tenant Azure platform spanning 15+ microservices. I design the pipelines, health gates, and rollback paths that decide whether a release ships — and I own the recovery when it doesn't.

WORK EXPERIENCE

DevOps Engineer | Thomson Reuters

Jun 2023 – Present · Bangalore, India

Own release, upgrade, and disaster-recovery automation for a multi-tenant legal platform across multiple Azure regions and environments.

Release Engineering & Upgrade Automation

- Eliminated manual upgrade runbooks across 15+ microservices by building unattended Ansible orchestration with feature-flag-driven service loops, per-service rescue blocks, automatic rollback, and real-time per-group failure reporting.
- Removed unverified-backup risk from every deployment by gating releases on T-SQL-verified transaction-log backups, RESTORE-based rollback, and Datadog failure hooks, with a safe-skip flow that polls running SQL Server tasks to avoid unnecessary downtime.
- Cut manual promotion steps from container releases by automating image promotion across environments in GitHub Actions, integrating the Azure DevOps REST API with a real-time polling loop that streams ACR/AKS build logs into the GitHub console.
- Stood up on-premises deployment from zero tooling by building Jinja2 config templates, idempotent SQL Server initialization, pre-flight input validation, and version-gated JVM/runtime provisioning for Spring Boot migrations.

Reliability, Disaster Recovery & Observability

- Extended DR coverage to modernized microservices by building failover/failback orchestration that drives maintenance-vs-active state transitions through Azure Service Bus, with structured event logging in Datadog.
- Achieved zero data loss across Azure region migrations for databases and application servers by executing restore, HA mirroring, and rollback through same-region and cross-region migration runbooks.
- Prevented false-healthy restarts on Apache by implementing a four-condition health gate — service state, HTTP 200, load-balancer convergence, healthcheck file — plus configurable drain timeouts with fail-fast validation on undefined thresholds.
- Eliminated transient-fault pipeline failures by adding retry/backoff (5 attempts, 2s delay) and defensive checks that guarantee failure alerts still publish through WinRM connectivity loss.
- Extended health visibility to every microservice by rolling out HTTP, TCP, and JMX monitoring with dynamic template generation, standardized tagging, and dependency-aware agent restarts.
- Cut failed-deployment detection time by instrumenting release playbooks with deployment telemetry, execution summaries, and Teams alerting across weekend and off-hours deployment windows.

Platform Engineering, Security & Cost

- Removed a recurring three-place manual edit across 15+ microservices by refactoring multi-environment Ansible inventories into a single environment-agnostic, reusable model.
- Closed an unrestricted-execution security gap by building two RBAC gate workflows restricting execution to authorized support and engineering teams, and integrating BYOK encryption via Key Vault and Azure App Configuration.
- Reduced compute spend across the estate by leading a jumpbox VM family upgrade through ITSM change management, covering staging, execution documentation, and production cutover.

DevOps Engineer | GraniteRiverLabs

Sep 2021 – Jun 2023 · Bangalore, India

- Standardized release delivery by building Docker build, tag, push, and deploy pipelines, plus automated WiX installer signing and dpkg packaging in CI.
- Raised code-review consistency across GitHub repositories by enforcing linting, unit tests, and PR quality gates.
- Reduced attack surface for a .NET application by scoping AWS EC2 security groups and key-pair management to least privilege.
- Delivered Zigbee test automation for Project MATTER (CSA) and a custom Windows Wireshark installer by building a dedicated GitLab CI pipeline.

CORE COMPETENCIES

CI/CD & IaC: GitHub Actions, Azure DevOps (REST API), GitLab CI, Ansible, Jinja2, Bicep, ARM templates, Docker; working knowledge of Chef, Puppet, Bolt

Cloud: Azure — ACR, AKS, Service Bus, App Configuration, Key Vault (BYOK), Storage, Load Balancer, AzCopy, CLI; AWS — EC2, Security Groups

Reliability & SRE: DR failover/failback, SQL Server mirroring (HA), backup and restore verification, health-gated restarts, automated rollback, ITSM change management

Observability: Datadog, Pingdom, HTTP/TCP/JMX synthetic checks, deployment telemetry, Teams alerting

Platforms & Data: Windows Server, RHEL/Ubuntu, Apache HTTPD, Tomcat, SQL Server (T-SQL, backup/restore, mirroring), Solr, WinRM, Akamai

Languages: Bash/Shell, PowerShell/Batch, YAML, SQL, C/C++; working knowledge of Python

Security: RBAC gates in CI, centralized secret management, BYOK encryption, S/MIME commit signing, vulnerability scanning

EDUCATION

B.E., Electronics and Communication — MIT, Anna University, Chennai, India · Aug 2021
