

SRINIVASAN VIJAYARAGHAVAN

DevOps / Site Reliability Engineer — Cloud Infrastructure, Reliability & Release Automation

Bangalore, India | +91 97910 25934 | srinivasan.shyam2000@gmail.com | srinidevops.com

U.S. Citizen / OCI Holder — Authorized to work in the United States and India

PROFESSIONAL SUMMARY

DevOps / Site Reliability Engineer with 5 years of experience building and operating release, upgrade, and disaster-recovery automation for a multi-tenant Azure platform spanning 15+ microservices. Work is organized around the five pillars of DevOps: troubleshooting, incident command, monitoring and reliability, cloud infrastructure, and IaaS/PaaS/SaaS delivery. Experienced in designing the pipelines, health gates, and rollback paths that decide whether a release ships, and in owning recovery when it does not. Core strengths include CI/CD automation (GitHub Actions, Azure DevOps, GitLab CI), infrastructure as code (Ansible, Bicep, ARM), and cloud platform engineering on Azure and AWS.

CORE COMPETENCIES

CI/CD & IaC: GitHub Actions, Azure DevOps (REST API), GitLab CI, Ansible, Jinja2, Bicep, ARM templates, Docker, Chef, Puppet, Bolt

Cloud Platforms: Microsoft Azure (ACR, AKS, Service Bus, App Configuration, Key Vault, Storage, Load Balancer, AzCopy, CLI), AWS (EC2, Security Groups)

Reliability & SRE: Disaster recovery failover/failback, SQL Server high-availability mirroring, backup and restore verification, health-gated restarts, automated rollback, ITSM change management

Monitoring & Observability: Datadog, Pingdom, HTTP/TCP/JMX synthetic checks, deployment telemetry, Microsoft Teams alerting

Platforms & Data: Windows Server, RHEL, Ubuntu, Apache HTTPD, Tomcat, Microsoft SQL Server (T-SQL, backup/restore, mirroring), Solr, WinRM, Akamai

Languages & Scripting: Bash/Shell, PowerShell, Batch, YAML, SQL, Python, C/C++

Security & Compliance: Role-based access control (RBAC) in CI/CD, centralized secret management, Bring Your Own Key (BYOK) encryption, S/MIME commit signing, vulnerability scanning

PROFESSIONAL EXPERIENCE

DevOps Engineer — Thomson Reuters

Jun 2023 – Present | Bangalore, India

Own release, upgrade, and disaster-recovery automation for a multi-tenant legal-technology platform across multiple Azure regions and environments. Experience is organized below by the five DevOps pillars.

1. Troubleshooting

- Reduced pipeline failures caused by transient network and connectivity faults by designing a retry-and-backoff strategy (5 attempts, 2-second delay) with defensive checks, ensuring failure alerts still published even during WinRM connectivity loss.
- Eliminated false-healthy service restarts on Apache HTTPD by implementing a four-condition health gate (service state, HTTP 200 response, load-balancer convergence, health-check file), with configurable drain timeouts and fail-fast validation on undefined thresholds.
- Reduced unnecessary deployment downtime by building a safe-skip flow that polls active SQL Server tasks before triggering backup verification during releases.

2. Incident Command

- Extended disaster-recovery coverage to all modernized microservices by building failover/failback orchestration that drives maintenance-versus-active state transitions through Azure Service Bus, with structured event logging in Datadog for faster incident triage.
- Achieved zero data loss across multiple Azure region migrations for databases and application servers by executing restore, high-availability mirroring, and rollback through same-region and cross-region migration runbooks.
- Removed unverified-backup risk from every production release by gating deployments on T-SQL-verified transaction-log backups, with RESTORE-based rollback and Datadog failure hooks triggering the incident response path.

3. Monitoring & Reliability

- Extended health visibility to every microservice in the platform by rolling out HTTP, TCP, and JMX synthetic monitoring with dynamic template generation, standardized tagging, and dependency-aware agent restarts.
- Cut the time to detect failed deployments by instrumenting release playbooks with deployment telemetry, execution summaries, and Microsoft Teams alerting across weekend and off-hours deployment windows.

4. Cloud

- Cut manual promotion steps out of container releases by automating image promotion across environments in GitHub Actions, integrating the Azure DevOps REST API with a real-time polling loop that streamed ACR and AKS build logs directly into the GitHub console.
- Closed an unrestricted-execution security gap in the deployment pipeline by building two RBAC-gated workflows restricting execution to authorized support and engineering teams, and integrating BYOK encryption via Azure Key Vault and Azure App Configuration.
- Reduced monthly compute spend across the Azure estate by leading a jumpbox VM family upgrade through formal ITSM change management, covering staging, execution documentation, and production cutover.

5. IaaS / PaaS / SaaS

- Eliminated manual upgrade runbooks across 15+ microservices by building unattended Ansible orchestration with feature-flag-driven service loops, per-service rescue blocks, automatic rollback, and real-time per-group failure reporting.
- Stood up on-premises deployment capability from zero existing tooling by building Jinja2 configuration templates, idempotent SQL Server initialization, pre-flight input validation, and version-gated JVM/runtime provisioning to support Spring Boot migrations.
- Removed a recurring three-place manual edit across 15+ microservices by refactoring multi-environment Ansible inventories into a single, environment-agnostic, reusable model.

DevOps Engineer — GraniteRiverLabs

Sep 2021 – Jun 2023 | Bangalore, India

- Standardized release delivery by building Docker build, tag, push, and deploy pipelines, plus automated WiX installer signing and dpkg packaging in CI.
- Raised code-review consistency across GitHub repositories by enforcing linting, unit tests, and PR quality gates.
- Reduced attack surface for a .NET application by scoping AWS EC2 security groups and key-pair management to least privilege.
- Delivered Zigbee test automation for Project MATTER (CSA) and a custom Windows Wireshark installer by building a dedicated GitLab CI pipeline.

EDUCATION

Bachelor of Engineering, Electronics and Communication

MIT, Anna University, Chennai, India — Aug 2021
