SUMMARY

DevOps Engineer with 5 years of turning fragile, manual deployments into fast, reliable automation across AWS and Azure. I build the pipelines, safety nets, and monitoring that let teams ship confidently — and I'm now leveling up toward Cloud Solutions Architecture.

CORE COMPETENCIES

- CI/CD & Automation: GitHub Actions, GitLab CI, pipeline design, rollback/promotion workflows, code quality gates
- Cloud Platforms: AWS (EC2, Security Groups, Key Pairs) · Azure (Storage, NLB, App Config, ACR, AzCopy, Bicep, Azure DevOps Services)
- Configuration & Containers: Ansible, Jinja2, vars/vault architecture, Docker, ARM images, WiX & dpkg packaging
- Scripting & Languages: Python, Bash/Shell, Batch, YAML, C/C++, .NET deployment automation
- Monitoring & Systems: Datadog, HTTP/service health validation, SSH, Wireshark, Linux/Ubuntu, Windows Server, RHEL, Network Administration
- Microservices & Migrations: Service provisioning, DB scripting, traffic routing, Azure migrations, DR operations
- Additional Certified Skills: Cloud Architecture & Solution Design, Cloud Computing Fundamentals, Software Architecture, Cloud Development, Apache Web Server & Tomcat, MySQL, PHP

WORK EXPERIENCE

DevOps Engineer | Thomson Reuters *Jun 2023 – Present · Bangalore, India*

Automation & Workflow Engineering

- Replaced manual deployment runbooks with self-service workflows, as measured by full self-service coverage of instance provisioning, configuration promotion, multi-instance operations, and DR failover/failback, by designing and shipping a complete GitHub Actions automation suite.
- Caught failures before they reached production, as measured by environment-aware validation gates across Apache, NLB, and service-health checks, by hardening workflow security with dynamic workflow naming, permission-based access controls, and real-time logging.
- Reduced recovery time and manual cleanup after failed deployments, as measured by faster DB restoration, service resets, checkpoint cleanup, and synced external systems (Akamai, Pingdom), by building automated rollback and recovery pipelines.
- Delivered migration-summary reporting and inventory generation for stakeholders, as measured by cross-platform automation linking GitHub Actions, Azure Pipelines, and SAS-authenticated Azure Table Storage, by building the integration end-to-end.

Configuration Management & Ansible Engineering

- Eliminated environment drift across every deployment environment, as measured by a fully standardized configuration baseline, by architecting a centralized variable and secret-management system (vars.yml / vault.yml).
- Removed a recurring source of manual configuration errors, as measured by consistent cross-environment configuration state, by automating duplicate-key cleanup, lifecycle updates, and ID normalization.
- Enabled selective BYOK configuration across environments, as measured by clean Azure App Config integration, by building conditional Jinja2-templated logic with selective property copying.
- Made provisioning repeatable and less error-prone across teams, as measured by enforced validation checks on every deployment, by modularizing Apache deployment and restart workflows.

Monitoring, Validation & Reliability

- Stopped bad deployments before they impacted users, as measured by service-state, HTTP 200, NLB convergence, and healthcheck verification, by building a fail-fast Apache validation framework.
- Gave the team real-time visibility into rollout health, as measured by Datadog dashboards, alerting, and Teams notifications wired directly into deployment pipelines, by integrating monitoring into the CI/CD flow.
- Improved overall pipeline resilience, as measured by robust handling of DR operations, connectivity failures, and DB sync issues, by engineering error handling for microservice-specific edge cases.

Cloud, Networking & Migration Automation

- Eliminated manual DNS changes across environments, as measured by fully automated MX and record updates, by scripting DNS cutovers in Python against the Akamai API.
- Sped up large-scale data transfers and reduced migration downtime, as measured by parallelized delta detection and transfer via custom runners and AzCopy, by building a migration framework across Azure Storage.
- Kept environments consistent during platform migrations, as measured by synchronized shared resources across Solr and application servers, by designing the synchronization and migration framework.

Microservices Deployment & Platform Enhancements

- Supported continuous platform modernization, as measured by successful end-to-end provisioning and upgrades of internal microservices, by scripting dynamic DB configs, startup configs, routing rules, and validation checks.
- Streamlined status communication across teams, as measured by consistent modernization and maintenance-status workflows, by building service messaging, endpoint validation, and tenant DB updates.

DevOps Engineer | GraniteRiverLabs *Sep 2021 – Jun 2023 · Bangalore, India*

- Cut release steps from manual to one-click, as measured by fully automated Docker image pipelines for frontend and backend, by building tagging, pushing, and deployment workflows.
- Secured AWS-hosted .NET application access, as measured by correctly scoped inbound/outbound rules and key-pair management, by deploying and configuring EC2 Security Groups.
- Delivered signed, release-ready installers with no manual packaging, as measured by fully automated WiX-based installer testing, by designing the pipeline in GitHub Actions.
- Standardized build and deployment automation across the team, as measured by consistent CI for Linux applications, by managing dpkg-based packaging.
- Raised code-review consistency across contributors, as measured by enforced linting, unit testing, and PR quality gates, by restructuring GitHub repositories.
- Improved ongoing system performance visibility, as measured by optimized ARM-based machine images and monitoring scripts, by writing Bash/Shell automation.
- Enabled smart-device interoperability testing, as measured by working Zigbee automation for Project MATTER (CSA), by implementing the associated deployment pipelines.
- Supported ongoing THREAD protocol analysis, as measured by a custom Windows-based Wireshark installer, by creating and enhancing it through GitLab CI.

EDUCATION

B.E., Electronics and Communication — MIT, Anna University, Chennai, India · Aug 2021
